

Accepted by
more platforms and
operating systems
than any other
frame grabber.

Active Silicon LFG cards set a new standard for low-cost video acquisition. These high-performance frame grabbers are available in PCI, PMC and PC/104-Plus formats ...together with a Software Developers Kit, to support PC, MAC and embedded operating systems.

The software libraries include royalty-free JPEG and wavelet image compression, with drivers for Windows 98/NT/2000/XP, DOS, Linux, VxWorks and MacOS X ...using a common API. You can also use third-party applications via drivers such as Twain and CVB. So it is easy to develop machine vision and other image processing applications in manufacturing, medical imaging, remote monitoring and security.

If you need an acquisition solution, one of these flexible cards should do nicely!
